## EDUCATION

---

**York University**  
*Bachelor of Arts in Computer Science*

Toronto, Canada  
*Expected May 2028*

## EXPERIENCE

---

**QA Automation Intern**  
*Government of Ontario*

May 2026 – Present  
*Toronto, Ontario*

- Developed and refactored **40+** end-to-end test scripts using **UFT** and **VBScript**, streamlining smoke and regression cycles to reduce manual testing effort by **60%**.
- Integrated automated scripts into the **CI/CD** pipeline via **OpenText ALM**, enabling continuous sanity checks and increasing functional test coverage by **35%**.
- Conducted root-cause analysis on pipeline failures to isolate environment instability, network flakiness, and **12+** critical regressions within **Jira** and **ALM**.

**Software Developer**  
*Sanskrita Bharati (via Riipen)*

April 2026 – June 2026  
*Toronto, Ontario*

- Developed a **WebRTC** & **WebSocket** media engine in **Node.js** for **10,000+** learners, offloading **100%** of video processing overhead via peer-to-peer streaming.
- Built an asynchronous matchmaking queue using a JSON signaling protocol, automating **100+** weekly connections and cutting manual coordination by **80%**.
- Secured the platform by deploying **TLS** encryption (**HTTPS/WSS**) via reverse proxies, mitigating **MITM** risks for **100%** of data in transit.

## PROJECTS

---

**VaultGuard** | *Python, Flask, SQLite*

- Built a full-stack password manager with secure client-side **AES-GCM** encryption and **Argon2** authentication, implementing a zero-knowledge style design for protecting sensitive user data.
- Designed and optimized a relational **SQLite** database schema to store encrypted credentials, users, and metadata, supporting fast queries, indexing, and secure data handling.
- Developed a feature-rich credential vault and validated security by testing against **10+** simulated malware/keylogging scenarios in a virtual machine, with no plaintext credentials exposed.

**Home Lab** | *Linux, Docker, Tailscale, WireGuard*

- Hardened a Linux-based server orchestrating **15+** **Docker** services, leveraging **SELinux** policies to enforce Mandatory Access Control (MAC) and container isolation.
- Reduced the external attack surface by implementing a Zero-Trust Network via **Tailscale**, replacing all vulnerable port forwarding with an encrypted, identity-based **WireGuard** mesh VPN
- Secured network traffic via a **Pi-hole** DNS sinkhole, successfully blocking **25%** of outbound requests to mitigate telemetry exfiltration and C2-based malware threats.

## TECHNICAL SKILLS

---

**Languages:** Python, Java, C, JavaScript, SQL, HTML, CSS

**Systems & Scripting:** Linux, Bash, Powershell, Git, Docker, VMware

**Networking & Security:** TCP/IP, DNS, Firewalls, VPN, VLANs, IDS/IPS
